The screenshot shows a detailed dataset page on the data.depositar.io platform. The page is titled 'Coral Reef Soundscapes off Sesoko Island, Okinawa, Japan'. It includes a description of the dataset as an archive of audio data from shallow-water and upper mesophotic coral reefs. Key sections include 'Recording Locations' (listing three sites: Site A, Site B, and Site C), 'Acoustic Recorders' (AUSOMS-mini stereo recorders), 'Configuration of Audio Recording' (specifying duty cycle, sampling rate, and file format), 'Field Deployment', 'Data Processing', and 'Associated Publication'. The page also features a 'Data and Resources' section with links to audio data and long-term spectrograms for each site, a 'Tags' section with categories like 'Acoustic diversity' and 'Coral reef', and a 'Wikidata Keywords' section. Basic information such as 'Data Type' (Source code, Audiovisual data, Scientific and statistical data formats) and 'Spatio-temporal Information' (Temporal Resolution: Daily, Start Time: 2017-05, End Time: 2018-07) is provided. The footer includes the data.depositar.io logo and contact information.

Coral Reef Soundscapes off Sesoko Island, Okinawa, Japan

This dataset is an archive of audio data of shallow-water and upper-mesophotic coral reefs off Sesoko Island, Okinawa, Japan. Python codes to visualize the audio data were also provided in a notebook based on Google Colab.

Recording Locations

Three long-term recording sites were established since May 2017. Site A (N26.635° E127.865°) is located on the southeast coast of Sesoko Island and in front of the Sesoko Station of the University of the Ryukyus. The water depth is 1.5 m. Site B (N26.665° E127.869°) is located at the bottom of a reef slope on the north of Sesoko Island and the west of Toguchi Port. The water depth is 20 m. Site C (N26.670° E127.866°) is located on a nearly flat plateau to the north of Sesoko Island and the west of Toguchi Port. The water depth is 40 m.

Acoustic Recorders

[AUSOMS-mini stereo recorders](#) (AquaSound, Kobe, Japan) were used to collect underwater sounds. From May 2017 to July 2018, six AUSOMS-mini recorders were used: 14-0106, 14-0107, 15-0106, 15-0107, 15-0109, 15-0110.

Configuration of Audio Recording

(1) Duty Cycle: continuous. (2) Sampling Rate: 44.1kHz. (3) Channels: 2. (4) File Format: MP3 (128 kbps). (5) Audio Gain: High. (6) High Pass Filter: Off.

Field Deployment

At each recording site, one AUSOMS-mini stereo recorder was fixed to a cement

Cut to clipboard

Deployment and recovery of recorders were conducted by divers.

Data Processing

Audio recordings generated by AUSOMS-mini recorders were saved in MP3 format. Each MP3 is about 8-hour long and do not have a time stamp on the file name. To facilitate data management, we segmented the 8-hour long MP3 into WAV files of 5-min duration.

We used the [LTSA_gui](#) to generate long-term spectrograms (LTS) and save the LTS in mat files. Each mat file contains median-based LTS and mean-based LTS. Median-based LTS was obtained by measuring median power spectral densities within each 5-min segment. Mean-based LTS was obtained by measuring mean power spectral densities within each 5-min segment.

ABSTRACT

Information on biodiversity is essential to evaluate the ecological status of coral reefs. Sounds produced by reef-associated organisms have been used as a biodiversity indicator. However, the interference from abiotic sounds and the lack of a comprehensive audio library have impeded effective evaluation. This study investigated the application of underwater soundscapes as a remote-sensing method to detect biological and anthropogenic activities. Using techniques including the visualization of long-duration recordings, source separation, and clustering, soundscapes were separated into sounds of anthropogenic and biological sources. Our results revealed the dynamics of biological sounds among coral reefs off Sesoko Island, Okinawa, Japan. Biological sounds were much more prominent in shallow-water reefs than in upper-mesophotic reefs, but their spectral features and compositions differed. The shallow-water reefs were dominated by broadband sounds of crustaceans and low-frequency transient fish calls, whereas the upper-mesophotic reefs were characterized by a diverse array of fish choruses and transient sounds. We also discovered that shipping noise heavily interfered with the soundscapes from the upper-mesophotic reefs and represented an invisible threat to life in the low-light habitat. The applied techniques of soundscape information retrieval revealed the distinct ecological status of coral reefs and the behavior change of sound-producing organisms in high temporal resolution. Implementation of soundscape monitoring can generate ecological information on habitat quality, reef biodiversity, human activities, and their interactions. Global collaboration on underwater soundscapes will establish a data-informed platform and help stakeholders assess the resilience of coral reefs to environmental and anthropogenic stressors.

1. Introduction

Marine ecosystems provide irreplaceable services and currently face significant pressures due to climate change, human disturbance, and excessive use of marine resources. The United Nations has recognized these threats and placed the conservation of marine ecosystems as one of its sustainable development goals (UN General Assembly, 2015). Coral reefs support various social and economic activities, such as fisheries, coastal protection, and tourism, of many maritime tropical and subtropical nations (Moberg and Folke, 1999; Barbier, 2017; Spalding et al., 2017; Woodhead et al., 2019). These benefits rely on the abundant biodiversity in coral reefs. However, coral reefs have undergone recurrent high-frequency bleaching episodes over the past 20 years due to increased sea surface temperatures (Hughes et al., 2017, 2018). Therefore, detailed information on the spatiotemporal changing patterns of marine biodiversity and interactions with human activities is crucial for

the conservation management of coral reefs.

Biodiversity monitoring in coral reefs remains challenging, partially due to the distinct reef environments and their unique fish assemblages (Pearman et al., 2018; Dumalagan et al., 2019). A comprehensive and long-term assessment of reef biodiversity, environmental characteristics, and human activities may not be feasible because of limited resources for observation and survey opportunities, especially for developing regions or remote reefs. An underwater sensing system capable of monitoring the changing patterns of marine biodiversity, with the ability to diagnose potential risks due to environmental and anthropogenic stressors, is required for establishing management strategies of coral reefs and for providing alerts to the early-warning signs of ecosystem changes (Schmeller et al., 2017; Obura et al., 2019).

A potential solution for such an underwater sensing platform is through monitoring ocean sounds. One autonomous recorder can store long-duration audio recordings, with improved time resolution of

With the recent development of underwater technology and audio information retrieval techniques, a soundscape monitoring network can generate numerous acoustic data that contain ecological information in multiple dimensions, including the quality of the acoustic habitat, community of sound-producing organisms, and potential effects due to human activities. The generated information will allow managers and stakeholders to conduct a more comprehensive assessment of ecosystem health at scale.

Data availability

In search of ancestors

More thought needs to be put into the preservation of Taiwan's public cemeteries, not destroyed to make way for apartment buildings in a country with a declining birth rate

By Linda Gail Arrigo / Contributing reporter

For Taiwanese in an earlier time, most of family life revolved around parents and veneration for previous generations who had passed on to their descendants the source of sustenance — land. You could see the lush green rice fields terraced up the hills, or golden with stalks bending under the grains heavy before harvest. I knew that daughters-in-law regularly placed bowls of rice and meat on family altars on which were tablets with names of the ancestors.

When I was 18, in 1967, a handsome young man invited me to go with his family by car to their ancestral farm in New Taipei City's Sansia District (三峡). His grandmother, a tiny woman with bound feet, quickly changed into a snow-white blouse. She signaled for us to kneel before the family altar holding incense sticks. I did not understand until later that we had thus pledged to continue the family line.

Collaborative Badlands | 惡地協作

以台南左鎮為實驗場域，對外延伸至其他惡地形地區，包括台南龍崎、以及高雄田寮、內門等地區，建立地方研究、教學、服務等各項工作。由國立成功大學推動的協力計畫。

A collaborative project at the National Cheng Kung University on the rural regeneration and transdisciplinary research in the Southwestern Taiwan Badlands Region.

COLLABORATIVE BADLANDS

惡地協作跨領域協作教學研究群 / Collaborative Badlands Project

惡地協作跨領域協作教學研究群為國立成功大學都市計劃學系與中央研究院人社中心地理資訊科學研究專題中心合作建立之社區地理資訊系統(Community GIS)專案之一部分，主要目的以台南左鎮為實驗場域，對外延伸至其他惡地形地區，包括台南龍崎、以及高雄田寮、內門等地區，建立地方研究、教學、服務等各項工作之資料庫，希望整合既有的資訊、資源與技術，建立在地知識之整合平台，鏈結跨領域跨尺度之成員，促進在地協作交流創新之網絡。

惡地協作跨領域協作教學研究群 / Collaborative Badlands Project

惡地協作跨領域協作教學研究群為國立成功大學都市計劃學系與中央研究院人社中心地理資訊科學研究專題中心合作建立之社區地理資訊系統(Community GIS)專案之一部分，主要目的以台南左鎮為實驗場域，對外延伸至其他惡地形地區，包括台南龍崎、以及高雄田寮、內門等地區，建立地方研究、教學、服務等各項工作之資料庫，希望整合既有的資訊、資源與技術，建立在地知識之整合平台，鏈結跨領域跨尺度之成員，促進在地協作交流創新之網絡。

資料庫內容目前已初步彙整以下三類資料：1) 以左鎮、龍崎、田寮、內門為關鍵字進行網路搜尋的獲得的二手資料，包括影音、論文、報告、網站等資訊。2) 國立成功大學惡地協作相關課程參與之學生作品、報告書、以及圖資 3) 歷史照片掃描檔

資料庫內容仍持續建置中，歡迎回饋與協作，若有引用也煩請標註資料原始出處。

相關問題請洽：國立成功大學惡地協作團隊 collaborativebadlands@gmail.com；國立成功大學都市計劃學系 張秀慈老師 hsiutzuchang@mail.ncku.edu.tw

本資料集建置經費部分由107年行政院農委會水土保持局農村再生創新研究計畫以及109-111年教育部大學社會責任實踐計畫補助
